This invention describes a novel gene which encodes a fusion protein of interleukin-6 (II-6) receptor and bound with a gene sequence encoding for II-6 at the downstream of II-6 receptor gene. The gene and its encoding protein has applications for the growth of bone marrow stem cells and platelets. Transmission of a signal of II-6 to target cells for stimulation with reduced antigenicity is possible. This sequence represents the II-6 receptor/II-6 fusion protein described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; Page 5-8; 8pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents the amino acid sequence of human interleukin (II)-6R-alpha-Fc. The protein is used in the course of the invention. The specification describes cytokine antagonists component only the extracellular domain of the specificity-determining component of the cytokine receptor and the extracellular domain of a signal-transducing component of the cytokine receptor. The cytokine is an interleukin (II-1, II-2, II-3, II-4, II-5 or II-15), granulocyte macrophage colony-stimulating factor (CM-CSF), gamma-interferon or transforming growth factor-beta (TGF-beta). The antagonist is capable of transforming growth factor-beta (TGF-beta). The antagonist is capable of binding the cytokine to form a nonfunctional complex. The compounds have therapeutic activity as cytokine antagonists and can also be used in assays for identifying novel agonists and antagonists of cytokines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-DEC-1998.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein
The invention concerns production of antagonists to any cytokine that utilizes an alpha specificity determining component, which when combined with the cytokine, binds to a first beta signal transducing component to form a non-functional intermediate which then binds to a second beta signal transducing component causing beta-receptor dimerization, the soluble alpha specificity determining component of the receptor (gR-alpha) and the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form heterodimers (gR-alpha) should be the cytokine and the cytokine by the combined to the cytokine by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disulfide-bond

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC binding the cytokien to form a non-functional complex. The receptor components are shared by cytokines such as the CNTF (ciliary neurotrophic factor) family of cytokines. The invention provides the basis for the CC factor) family of cytokines. The invention provides the basis for the CC development of II-6 antagonists, as they show that if, in the presence of CI ligand, its alpha recepotr and its beta-1 receptor component, can be CC formed, it will effectively block the action of the ligand. Effective antagonists of II-6 or CNTF consist of heterodimers of the extracellular CC domains of the alpha specificity determining components of their CC receptors and the extracellular domain of gpl30. The resultant CC heterodimers, function as high-affinity traps, rendering the cytokine CC membrane-bound forms of their receptor. The nucleic acids and CC polypeptides are useful for treating cytokine-related diseases or CC disorders such as osteoporosis and primary and secondary effects of CC cancer including multiple myeloma or cachexia

The invention is useful for identifying agonists or antagonists of cytokine receptors for treating cytokine-related diseases or disorders e.g. cancer, cachexia, arthritis and osteoporosis. The present sequence is human I cachexia, arthritis and osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecules encoding fusion polypeptides capable of binding a cytokine to form a non-functional complex, useful for troptokine-related diseases or disorders, e.g. cancer, cachexia, art.

                                           This sequence represents an interleukin-6 (IL-6) receptor. Varien the receptor lacking either the immunoglobulin-like domain or the transmembrane and intracellular domain have IL-6 binding ability signal transfer ability. Either the full length or truncated IL-6 signal transfer ability. Bither the full length or truncated IL-6 receptors may be used for diseases caused by IL-6 such as multiply

The present invention describes a composition (I) comprising a recombinant DNAX cytokine receptor subunit-2 (DCRS2) polypeptide. The DCRS2 polypeptide is useful for binding ligands and for preparing antibodies. The DCRS2 polypeptide is also useful for modulating cell proliferation, for diagnostic and therapeutic applications, for detecting
                                                                                                                                                                                                       Novel composition comprising DNAX cytokine receptor subunit useful for regulating immune system function and for treatin immunological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAB36655

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  presence of their ligands and in drug screening assays. It is also useful for treating conditions such as immunological disorders. The present sequence represents a cytokine receptor subunit protein which is given in an alignment of various cytokine receptor subunits in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 468 AA;

The soluble agent is selected from glycoprotein 80 (gp80), or its portion spanning amino acids 113-323 and having receptor sites that interact with II.6 and competitively inhibit interaction between II-6 and hepatocytes; glycoprotein 130 (gp130), or its portion spanning amino acids 1-94 and 141-230 and having receptor sites that interact with II-6 and competitively inhibit interaction between II-6 and competitively inhibit interaction between II-6 and competitively inhibit interaction between II-6 and hepatocytes; II-6 peptides IVS41-ALA56, GIY77-GIU95 or GIN153-HIS165; and/or a combined betal and beta2 II-6 mutant. The method is used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting or treating infection of hepatocytes by hepatitis B virus using soluble agent which inhibits interaction between hIL-6 and hepatocytes, particularly hyper-IL-6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hepatitis B virus; HBV; glycoprotein 130; gp130; glycoprotein 80; gp80; hepatitis B infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a human interleukin-6 (IL-6) receptor alpha (IL-6R alpha). Fragments of IL-6 are used in the method of the invention. The specification describes a method for inhibiting or treating infection of hepatocytes by hepatitis B virus (HBV). The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Fig 9a-b; 38pp; English

                                                                                                                                                                                      GR molecule. Administration of the fusion protein results in the increased expression of one or more of MIP-lalpha, MIP-lbeta, RANTES or IP-10. Also claimed are a nucleic acid molecule encoding the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein in the host cell. The fusion protein, nucleic acid or vector can be used in the manufacture of a medicament for the prophylaxis or treatment of an infectious disease (especially AIDS caused by a M-trophic strain of HIV, or bacterial peritonitis), an inflammatory disorder or an immunological disorder (especially rheumatoid arthritis), when it is desirable to increase or resolve an immune response (claimed)
                                                                                                                                                                                                                                                                                                                                                The present sequence is the protein sequence of the human interleukin-6 receptor (IL-6R). A soluble receptor is obtained either through proteolytic cleavage or differential mRNA splicing splicing of IL-6R (see ABP72698). The present invention relates to a fusion protein (see ABP72702) comprising a functional IL-6 molecule and a functional DS-sIL-ABP72702)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240
```

The invention describes a composition of matter (I) comprising a substantially pure or recombinant DNAX cytokine receptor subunit 2 (DCRS2) polypeptide, a natural CRRS2 polypeptide, or a fusion protein comprising a DCRS2 sequence. A composition of matter comprises: a substantially pure or recombinant DCRS2 polypeptide comprising at least three distinct nonoverlapping segments of at least four amino acids

An agonist or antagonist of a mammalian DCRS2 is useful for modulating physiology or development of a cell or cell culture. Antibodies to a DCRS2 can be used for quantitative detection of interferon. The DCRS2 polypeptides and nucleic acids and their binding agents are potentially useful in treating and diagnosing disease, especially disease associated with the immune system. This is the amino acid sequence of human interleukin 6 (IL-6) receptor subunit alpha used in a comparision with

```
The invention concerns production of antagonists to any cytokine that cutilizes an alpha specificity determining component, which when combined with the cytokine, binds to a first beta signal transducing component to form a non-functional intermediate which then binds to a second beta calphal transducing component causing beta-receptor dimerization, the cytokine alpha specificity determining component of the receptor (sr-calpha) and the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form component of the cytokine by cytokine to form a non-functional complex. The receptor components are shared by cytokines such as the CNTF (ciliary neurotrophic development of II-6 antagonists, as they show that if, in the presence of cytokines, the invention provides the basis for the cytokine antagonists, as they show that if, in the presence of cytokine, it is alpha receptor and its beta-1 receptor component, can be cytokine it alpha receptor and its beta-1 receptor component, can be cytokine of the alpha specificity determining components of the extracellular domains of the ligand, it salpha specificity determining components of the cytokine conforms of the alpha specificity determining components of the cytokine conforms of the interacellular domains of specificity determining components of the cytokine conforms of the interacellular domains of specificity determining components of the cytokine conforms of their receptor. The nucleic acids and cytokine are useful for treating cytokine-related diseases or conservable myeloma or cachexia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
The invention concerns production of antagonists to any cytokine that utilizes an alpha specificity determining component, which when combined with the cytokine, binds to a first beta signal transducing component to form a non-functional intermediate which then binds to a second beta signal transducing component causing beta receptor dimerization, the soluble alpha specificity determining component of the receptor (sralpha) and the extracellular domain of the first beta signal transducing
                                                                                                                                                                                                                                                                             Isolated nucleic acid molecule for treating cytokine-related diseases disorders encodes a fusion polypeptide capable of binding a cytokine of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC component of the cytokine receptor (beta-1) are combined to form CC checked with the cytokine by combined to form the cytokine to form a non-functional complex. The receptor CC components are shared by cytokines such as the CNTF (ciliary neurotrophic CC factor) family of cytokines. The invention provides the basis for the CC development of IL-6 antagonists, as they show that if, in the presence of CC a ligand, a non-functional intermediate complex, consisting of the CC ligand, it will effectively block the action of the ligand. Effective antagonists of IL-6 or CNTF consist of heterodimers of the extracellular CC domains of the alpha specificity determining components of their cceptors and the extracellular domain of gpl30. The resultant CC receptors and the extracellular domain of gpl30. The resultant CC inaccessbile to form a signal transducing components of the native comborane-bound forms of their receptor. The nucleic acids and CC polypoptides are useful for treating cytokine-related diseases or CC disorders such as osteoporosis and primary and secondary effects of cancer including multiple myeloma or cachexia

Inhibition of expression of the II-6 receptor in useful in the treatment of kidney tumours, myeloma, Kaposi's Barcoma, rheumatoid arthritis, psoriasis and endotoxic shock. The antisense oligonucleotides are administered at a dosage of 0.1-100mg/kg, pref. O.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-DEC-1994;

                                                                                                                                                                                     The present sequence is the protein sequence of a soluble form of the human interleukin-6 receptor (IL-6R), denoted PC-SIL-6R, produced by proteolytic cleavage. A fusion protein of human IL-6 and PC-SIL-6R increases expression of MCP-1, but unlike a novel fusion protein of the invention (see Ampr2702) comprising IL-6 and DS-SIL-6R, does not increase expression of MIP-1alpha, MIP-1beta, RANTES or IP-10. The invention relates to this novel fusion protein and its use in the prophylaxis or relates to this novel fusion protein and its use in the prophylaxis or treatment of an infectious disease (especially AIDS caused by a M-trophic strain of HIV, or bacterial peritonitis), an inflammatory disorder or an immunological disorder (especially rheumatoid arthritis), when it is desirable to increase or resolve an immune response
                                                                                                                                                                                                                                                                                                                                                                                                        New fusion protein having a functional IL-6 and DS-sIL-6R molecule, useful for the manufacture of a medicament for the prophylaxis or treatment of an infectious disease, and an inflammatory or immunolo disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo

                                                                                                                                                                                                                                                                                                        CC component of the cytokine receptor (beta-1) are combined to form
CC heterodimers (8R-alpha:beta-1) that act as antagonist to the cytokine by
CC binding the cytokien to form a non-functional complex. The receptor
CC components are shared by cytokines such as the CNTF (ciliary neurotrophic
CC factor) family of cytokines. The invention provides the basis for the
CC development of II-6 antagonists, as they show that if, in the presence of
CC aligand, a non-functional intermediate complex, consisting of the
CC ligand, it will effectively block the action of the ligand. Effective
CC formed, it will effectively block the action of the ligand. Effective
CC antagonists of II-6 or CNTF consist of heterodimers of the extracellular
CC domains of the alpha specificity determining components of their
CC receptors and the extracellular domain of gpl30. The resultant
CC inaccessbile to form a signal transducing complex with the native
CC membrane-bound forms of their receptor. The nucleic acids and
CC polypeptides are useful for treating cytokine-related diseases or
CC cancer including multiple myeloma or cachexia

```

The specification describes cytokine antagonists comprising only the extracellular domain of the specificity-determining component of the cytokine receptor and the extracellular domain of a signal-transducing

the invention.

Example 4; Fig 15; 152pp; English

                         Isolated nucleic acid molecule for treating cytokine-related diseases disorders encodes a fusion polypeptide capable of binding a cytokine t form a nonfunctional complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     component of the cytokine receptor. The cytokine is an interleukin (IL-1, IL-2, IL-3, IL-4, IL-5 or II-15), granulocyte macrophage colony-stimulating factor (GM-CSF) gamma-interferon or transforming growth factor-beta (TGF-beta). The antagonist is capable of binding the cytokine to form a nonfunctional complex. The compounds have therapeutic activity as cytokine antagonists and can also be used in assays for identifying novel agonists and antagonists of cytokines
                                                                                                                                                                                                                                                                                                     25-SEP-1998;

                                     The invention concerns production of antagonists to any cytokine that cutilizes an alpha specificity determining component, which when combined component of the cytokine, binds to a first beta signal transducing component to component a non-functional intermediate which then binds to a second beta component to the cytokine receptor dimerization, the component of the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form component of the cytokine receptor (beta-1) are combined to form component of the cytokine receptor (beta-1) are combined to form components are shared by cytokines such as antagonist to the cytokine by cytokines such as the CNTF (ciliary neurotrophic factor) family of cytokines. The inventional complex. The receptor component of II-6 antagonists, as they show that if, in the presence of cytokines, the invention provides the basis for the cytokine, it salpha receptor and its beta-1 receptor component, can be cytokines of the alpha specificity determining components of the extracellular domain of gpl30. The resultant cytokines for the antagonists of the alpha specificity determining components of the extracellular domain of gpl30. The resultant cytokine are useful for treating cytokine realeting the cytokine components such as signal transducing complex with the native components such as osteoporosis and primary and secondary effects of cancer including multiple myeloma or cachexia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a novel fusion polypeptide capable of binding a cytokine to form a nonfunctional complex. The invention is useful for identifying agonists or antagonists of cytokine receptors an for treating cytokine-related diseases or disorders e.g. cancer, cachesia, arthritis and osteoporosis. The present sequence is human IL-

                                                                                                                                                                                                                                                                                                                                                                            The BSF2 receptor is derived from a monocyte U937 cell line. It can used to develop prophylactic and therapeutic pharmaceuticals, as age relate diseases and disorders to abnormal BSF-2 prodn. It can also used to study an immune mechanism with which BSF-2 or the receptor concerned. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Receptor protein for human B cell stimulatory factor-2 - used developing prophylactic, therapeutic and diagnostic agents for disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            25-MAR-2003

differential mRNA splicing. The invention relates to a fusion protein (see ABP72702) comprising a functional II-6 molecule and a functional DS-SIL-6R molecule. Administration the fusion protein results in the increased expression of one or more of MIP-labba, MIP-lbeta, RANTES or IP-10. High levels of MIP-labba, MIP-lbeta and RANTES complete with HIV for binding to CCR5 and effectively suppress HIV entry. The fusion protein can be used in the treatment of any disease in which the invention also provides a nucleic acid molecule encoding the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein in the host cell. The fusion protein, nucleic acid or vector can be used in the manufacture of a medicament for the prophylaxis or treatment of an infectious disease (especially AIDS caused by a M-trophic strain of HIV, or bacterial peritonitis), an inflammatory disease or resolve an immune response (claimed) when it is desirable to increase or resolve an immune response (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches 355;

                                                                                                                                                                                                                                                                                                                             This is a previously reported amino acid sequence for human interleukin-6 (C) (hIL-6) receptor alpha. The invention relates to the finding that hIL-6 (C) is essential for hepatitis B virus (HBV) infection. The invention (C) provides a pharmaceutical composition for the treatment of HBV infection, comprising a soluble active agent that interacts with at least one of the binding sites between hIL-6 and the pS1 region of HBV and between hIL-6 and hepatocytes and other HBV-permissive cells. The active agent competitively binds to at least one of these sites and thereby prevents thIL-6-mediated HBV infection of hepatocytes and other HBV-permissive cells. The soluble active agent is selected from glycoprotein 80 (gy80) having receptor sites which interact with hIL-6, bill-6 derived peptide Gln53-His165, a combined 1 and 2 hIL-6 mutant (mhIL-6 1+2), and mill-6 tysubstituted with Phel71 to Leu and Ser177 to Arg, and mixtures

This sequence represents the SR345 protein. The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a cDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is
                                                                                                                                                                                                                                                                                                                                                                                               Efficient and selective isolation of a gene encoding membrane puwith low or no antigenic binding activity, for diagnosis, study production of drugs treating abnormal functions of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gene isolation; membrane-bound protein; fusion protein; drug production; antigen-binding cell; secretable functional protein; antigenic protein; protein isolation; diagnosis; SR345 protein.
                                                                                                                                                                                                                                                                                                                                            Example 1; Page 49-52;

cytokine II-6 to form a non-functional complex. The invention concerns component of antagonists to any cytokine that utilizes an alpha compectation of antagonists to any cytokine when combined with the cytokine, chinds to a first beta signal transducing component to form a non-combined with the cytokine, component components and components are cytokine to form a non-functional complex. The receptor components are cytokine to form a non-functional complex. The receptor components are cytokine to form a non-functional complex. The receptor components are cytokines. The invention provides the basis for the development of II-components, as they show that if, in the presence of a ligand, a non-functional intermediate complex, consisting of the ligand, its alpha components and its beta-1 receptor component, can be formed, it will component component components and the sectively block the action of the ligand. Effective antagonists of the alpha components of their receptors and the extracellular domains of the alpha components of their receptors and the components of the cytokine components of their receptors and the components of their receptors and the cytokine-related diseases or disorders such as osteoporosis and primary components of components of their receptors and the cytokine are useful for treating components of components of their receptors and primary components of components of components of their receptors and primary components of components of their receptors and the cytokine components of their receptors and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           á

This sequence shows fusion polypeptide 412, which is capable of binding cytokine II-6 to form a non-functional complex. The invention concerns cytokine II-6 to form a non-functional complex. The invention concerns cytokine in the cytokine, and the cytokine, and the cytokine of antagonists to any cytokine that utilizes an alpha cytokine intermediate which then binds to a second beta signal transducing component to form a non-cytokine intermediate which then binds to a second beta signal cytokine intermediate which then binds to a second beta signal cytokine specificity determining component of the receptor (sR-alpha) and cytokine specificity determining component of the receptor (sR-alpha) and cytokine specificity determining component of the receptor cytokine intermediate cytokine as the cytokine are combined to form heteroidments are cytokine to form a non-functional complex. The receptor components are cytokine by cytokines such as the CNTF (ciliary neurotrophic factor) family of cytokines. The invention provides the basis for the development of II-cytokines. The invention provides the basis for the development of II-cytokines are they show that if, in the presence of a ligand, a non-functional intermediate complex, consisting of the ligand, its alpha cytokine intermediate complex, consisting of the ligand, its alpha cytokine intermediate of the intermediate complex with the nation of their receptors and the extracellular domains of the alpha cytokine cytokine cytokine with the native membrane-bound forms of their components of their comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             06-APR-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                12-FEB-2004
                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a novel fusion polypeptide capable of binding a cytokine to form a nonfunctional complex. The invention is useful for identifying agonists or antagonists of cytokine receptors for treating cytokine-related diseases or disorders e.g. cancer, cachesia, arthritis and osteoporosis. The present sequence is human cytokine trap protein

The invention relates to selecting or designing a compound that interacts with the interleukin-6 receptor (IL-6R) via assessing and obtaining the stereochemical complementarity between compound and a topographic region of the receptor and testing the compound for its ability to modulate an activity associated with the receptor. Also disclosed is the crystal structure of the IL-6R alpha chain. The compounds of the

The method provides enhanced stereochemical complementarity relative to the naturally occurring II-6 receptor ligand as well as a rational basis for the development of ligands for specific therapeutic applications. The information provided by the II-6R crystal structure will facilitate a more accurate understanding of how the binding of a ligand leads to signal transduction. The current sequence is that of the human II-6R alpha chain wild-type protein of the invention

An Hybrid peptides for binding cytokines, comprising a malaria parasite CC (Plasmodium falciparum) peptide (capable of binding to a red blood cell (RBC)) and a receptor peptide are claimed. R70103-25 are examples of CC (these hybrid peptides. R70122 is a fusion of interleukin 6 receptor (as CC confirmed with reference to SWISSPROT, as it is unclear in the CC specification whether this sequence is In6-R or In8-R typel) and CC glycophorin binding protein (GBP) 130. The use of cytokine receptors not CC RBC without deleterious effect. The RBC protects the hybrid peptides from RBC without deleterious effect. The RBC protects the hybrid peptides from CC excretion from the kidney, and due to steric hindrance prevents the excretion from the prefd. malaria parasite peptides used, others include homologue) are the prefd. malaria parasite peptides used, others include CC (SBA 175 (175 kDa erythrocyte binding antigen), PMWSA (pre major merozoite surface antigen) and the Duffy binding receptor molecule (eg. exhibited by Plasmodium vivax). These peptides hind to pref. glycophorin A, B and CC (Sialo glycoproteins, found on the surface of RBCs. The hybrid peptides CC are thus used to lower the levels of free cytokines in the circulation to CC (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             interact
                                                                                                                                                                                                                                                                                                                                                                                                                                          interact
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         interact
                                                                                                                                                                                                interact
```

```
The invention relates to selecting or designing a compound that interacts with the interleukin-6 receptor (II-6R) via assessing and obtaining the stereochemical complementarity between the compound and a topographic region of the receptor and testing the compound for its ability to modulate an activity associated with the receptor. Also disclosed is the crystal structure of the II-6R alpha chain. The compounds of the invention act as cytokine receptor modulators and may be useful in the prevention and treatment of diseases associated with signalling by II-6R such as multiple myeloma, inflammation, rheumatoid arthritis, prostate cancer, Castleman's disease, AIDS, mesangial proliferative glomerulonephritis, Kaposi's sarcoma, sepsis, osteoporosis and psoriasis.
                                                                                                                                                                              Selecting o

The information provided by the IL-6R crystal structure will facilitate a more accurate understanding of how the binding of a ligand leads to signal transduction. The current sequence is that of the human IL-6R alpha chain mutant protein of the invention which contains a V259Q substitution. Note: The present sequence is not shown within the specification but was created by the indexer using the human IL-6R alpha chain will-tree created.
